

University of Colorado at Boulder
Boulder, Colorado

Space Model

The University of Colorado at Boulder space planning model is allowing the campus to continually project space needs associated with its programs. Creating the model via a series of planning workshops and gaining input through campus personnel help JBA Incorporated assure variables in the model, and the approach, are programmatically driven and custom to the University of Colorado, Boulder. Projections and planning variables were not developed by national averages or designed around another campus.

Space evaluations were customized to reflect the unique nature of the University and space needs will be developed on how the campus wishes to operate. The space plan is being integrated into the campus master plan. The model was developed in a way that integrates into the University's annual facilities planning process as well as the long range master plans.

JBA's role on the project was programmer, planner, project manager and project architect.

Budget: N/A

Date: 2006
